

Why PRV drainpipe matters?

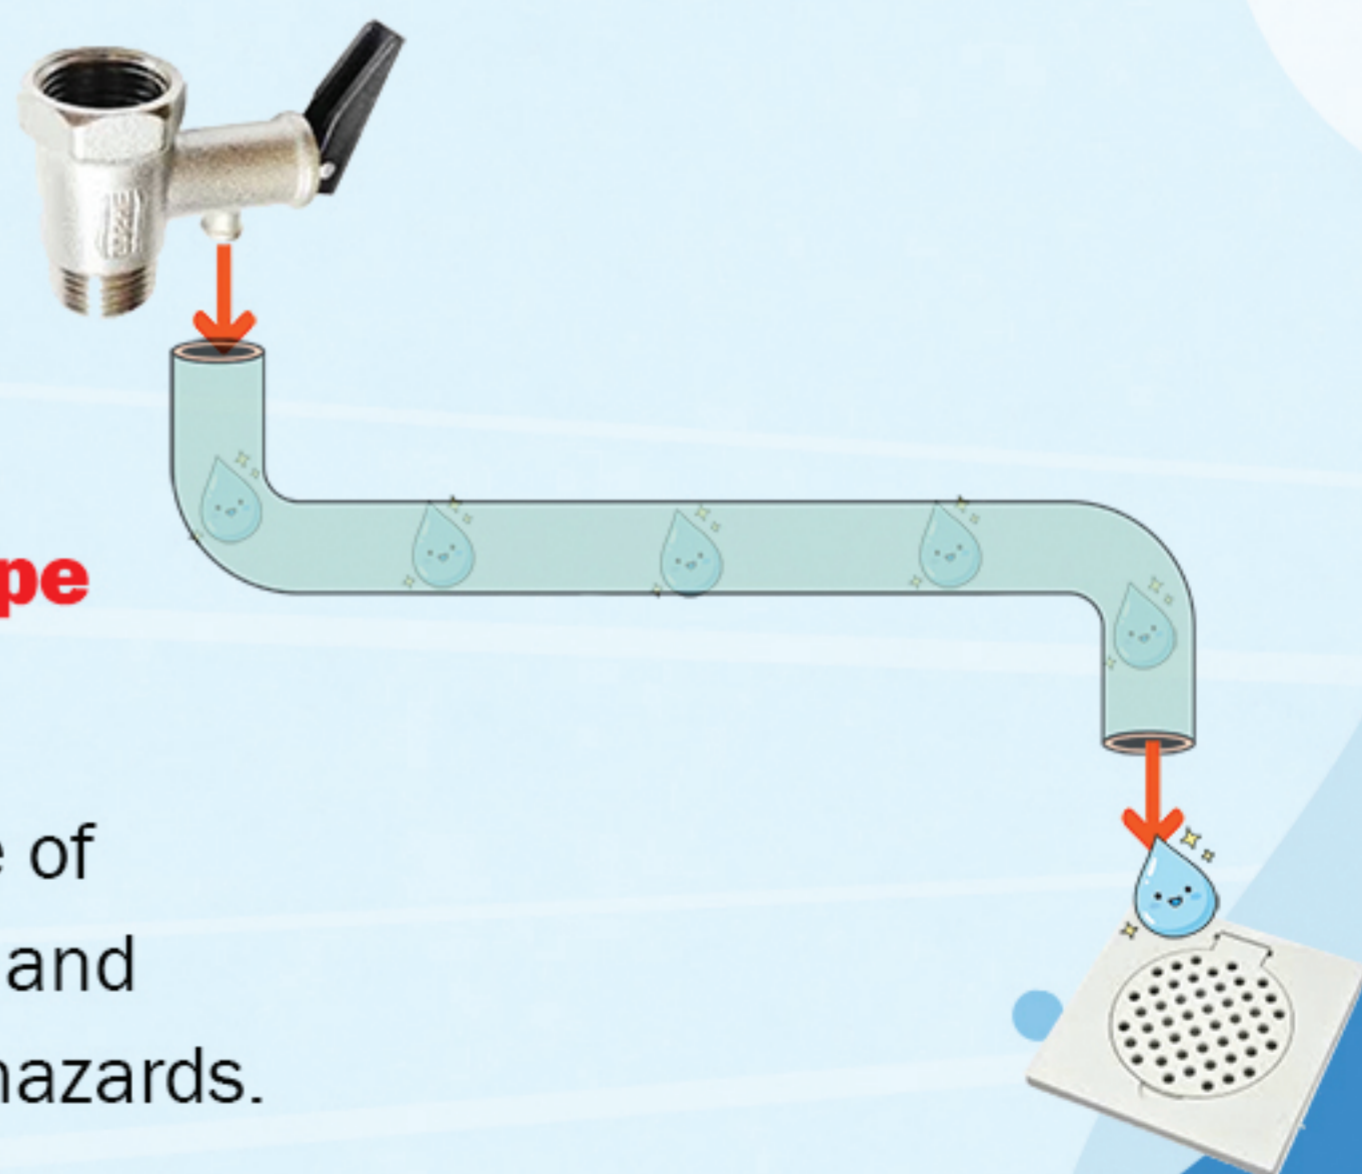

Drainpipe Choked

DID YOU KNOW?

A **choked drainpipe** can prevent proper discharge from the Pressure Release Valve (PRV).

It may cause **dangerous pressure build-up** inside the heater tank, increasing the risk of tank **rupture** or **bursting**.

Never ignore the drain pipe flow condition

Though small, it is the last line of defense protecting your home and family from hot water system hazards.

Drainpipe choked causes explosion
