

The Final Pressure Test Most Gas Heater Installers Skip

Comparison between this two:

VS

Final Pressure Test

Tests the entire gas installation in one pass. Binary result – the water level holds or it drops.

No interpretation. Customer can witness the result. Detects every leak regardless of size or location.

Handheld Detector

Tests one spot at a time. Misses small leaks below the sensitivity threshold.

Result depends on technician judgment and device calibration.

Does not test the whole system.

Most installers don't use either. They sign off with no test at all.
